

# Task: IP Addresses Distance Calculator

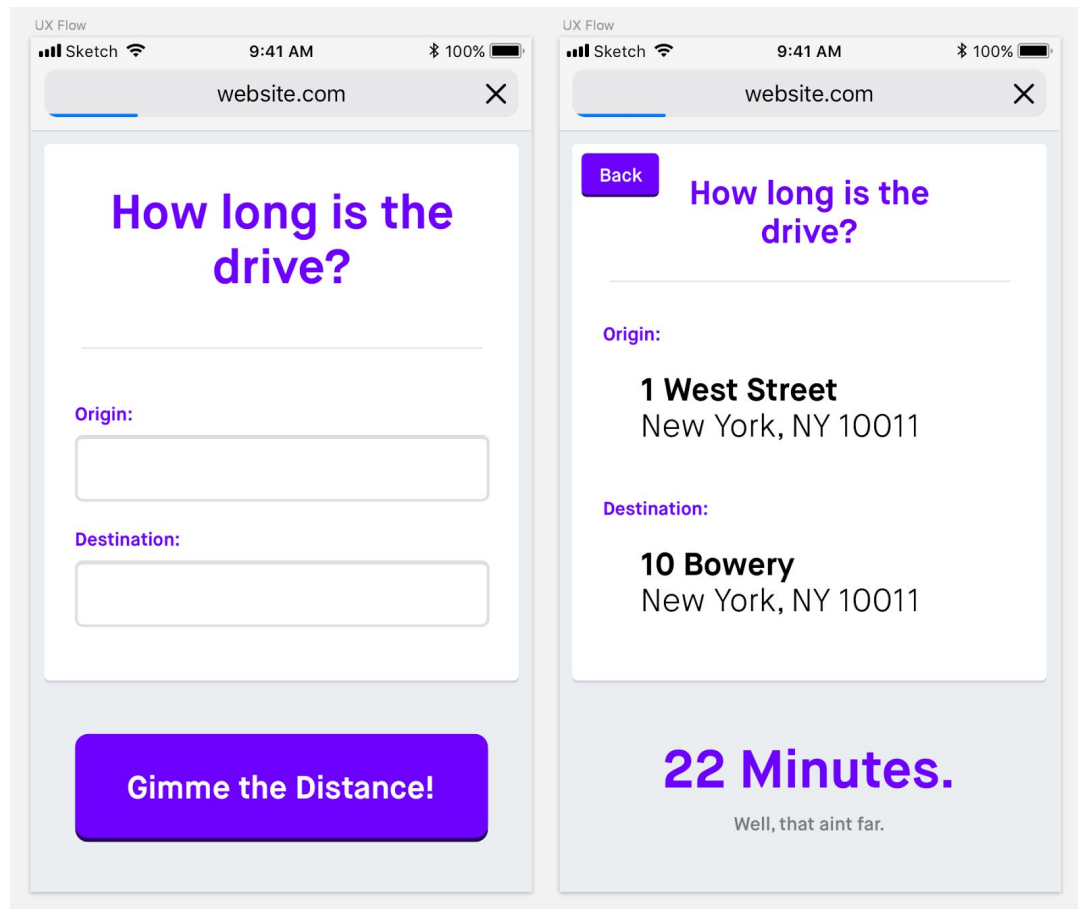

Create a mobile optimized single page React app that takes two **IP addresses** and displays the driving time between the two locations using two APIs:

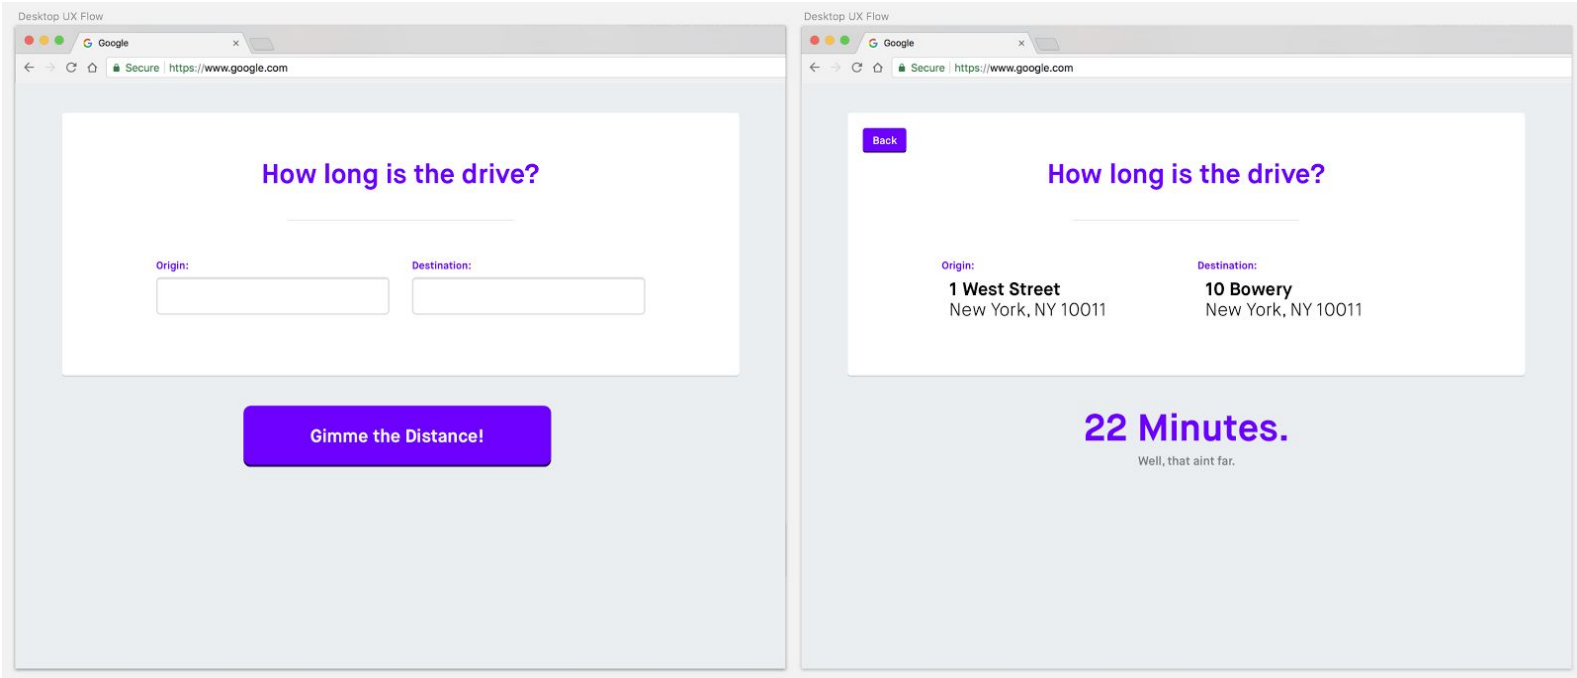

- [GraphQL Geolocation from IP](#)
- [Google Maps Directions API](#)

## Delivery:

The resulting web app should be hosted publicly, and the code shared via a github repo. This should take you about 4 hours. The time limit is 1 week, but the sooner we hear back from you, the sooner we can move the process forward!

## UX Flow:

- 1) As a user, I see inputs for my origin and destination.
- 2) As a user, I click the CTA, which shows me how long the drive is.

## Edge cases:

Please make it easy for the user to type IP address and handle errors and validate inputs.

**\* Bonus points for going above and beyond on any aspect.**
